

When installing millwork overhead, we need to confirm the type of clip being used is specifically for ceiling / overhead installations.

Many millwork clips are NOT designed for overhead installations and could allow the millwork to move and fall from the ceiling.

This is a typical Z-clip that is used for the wall attachments only

This is a typical interlocking clip that is used for the ceiling/overhead attachment

The ceiling / overhead clip attachment does not allow for lateral movement and is designed and engineered for horizontal orientation of installation

Keep in mind that the ceiling clip are typically thicker and needs more vertical room – coordinate early.

Please review this bulletin with the millworker and have them provide the clips being used to the quality department for coordination.
