

Double-check the height of the main and overflow roof drains. We do not want the overflow drains set too low; otherwise, they will hold water and dirt, discolor the membrane, standing water, mosquitoes, and potentially cause premature damage to the membrane over time.

The overflow drain should not be in a sump or in the same sump as the main drain.

Locations of drains will be discussed at the roof & plumbing pre-installation meetings, with height based on the roof insulation drawings.

Please talk to your roofer and make sure that they alert you if the drains are too low or incorrectly located.
