

When roofing is being installed, at the end of the day, the roof installer needs to install an “end-of-day seal”.

This will include the roofing membrane as well as the roof vapor retarder.

*We need this installed to prevent moisture from getting under the membrane from condensation, unexpected or expected rain.*

Proper end-of-day seal installed on the roofing membrane.

Roof penetration not sealed before the end of the day at the vapor retarder

Roof vapor retarder is not sealed before the end of the day
